Hiring Manager

Industrus Engineering

Dear Hiring Manager,

I am writing to apply for the Industrus Engineering Graduate Program. I am currently completing a Bachelor of Engineering in Software and Mechatronics at the University of Technology Sydney and have practical experience across software development, DevOps, networking, embedded systems and team leadership. The opportunity to rotate through different project roles and work on multidisciplinary engineering projects strongly aligns with the type of engineer I am working to become.

I understand the importance of ethical conduct and professional accountability in engineering. During my DevOps internship at Beachware, I worked with cloud deployment, server infrastructure and networking systems where changes could affect other users and services. I learned to approach technical changes carefully, verify information before acting and communicate issues to the appropriate team members. This experience reinforced the importance of taking responsibility for engineering decisions and maintaining professional standards when working with live systems.

I have demonstrated the ability to communicate effectively with engineers and stakeholders from different fields. At Beachware, I worked with technical team members and external vendors while resolving networking issues and discussing CI/CD technologies. In my work with ABC Services, I also collaborated with Electrical, Signalling & Communication and Software teams. These experiences required me to explain technical issues clearly, listen to different perspectives and coordinate work across disciplines.

I am comfortable working in creative, innovative and proactive environments. As Founder and CEO of Vaylo Technologies, I have been involved in developing an AI-powered business platform and coordinating development across frontend, backend and AI components. When technical or product problems arise, I work with the team to identify practical solutions and move the project forward. My engineering projects, including UTS Rocketry and embedded systems work, have further developed my ability to experiment, iterate and solve unfamiliar problems.

I have also developed strong information-management skills. My university, internship and startup work requires me to collect technical information, evaluate possible solutions, document decisions and use development tools such as Git, Supabase, Docker and cloud platforms to manage project information. During my internship, analysing network performance and CI/CD products required me to interpret technical information and communicate useful findings to others.

I manage my own performance by organising tasks, monitoring progress and taking responsibility for completing work to an appropriate standard. Balancing engineering study with technical projects, professional work and the development of Vaylo Technologies has required consistent planning and prioritisation. I seek feedback where required and adapt my approach when a task or technical issue changes.

Finally, I have demonstrated both teamwork and leadership. I led a team of five students during the Engineers Without Borders Challenge, delegating tasks, monitoring progress and helping the team resolve problems throughout the project. I now apply those leadership skills at Vaylo Technologies while continuing to work collaboratively in technical teams. I am comfortable contributing as a team member while also taking responsibility when leadership is required.

I would welcome the opportunity to contribute my software and mechatronics background, practical technical experience and willingness to learn to Industrus Engineering. The Graduate Program's combination of structured development,

mentoring and exposure to varied engineering projects would provide an excellent environment for me to continue developing as a professional engineer.

Thank you for considering my application. I look forward to the opportunity to discuss my suitability for the Industrus Engineering Graduate Program.

Yours sincerely,

Tarun Patel
